

The Executive Capacity Map

Guided capacity assessment for midlife cognition · Product overview · Charlie Robinson, PMHNP-BC · July 2026

What it is

The EC Map is a structured, pre-session intake that maps **functional cognition in midlife** — attention, working memory, initiation, organization, emotional load, and body-state factors — with ADHD-consistent and menopause-amplified pathways treated as **co-equal interpretations** rather than competing diagnoses. It is deliberately not a chatbot and not a diagnostic test. It is a capacity-mapping instrument that converts self-report into structured, clinically useful pre-session signal.

What the participant experiences

A single guided flow: brief context anchors (role, sleep, menopause transition, ADHD-relevant history, setting spread, timeline) → eight short conversation sections, each with eight scored prompts drawn from a curated 64-item spine → an open narrative → a deterministic safety check → report. Evidence and source notes stay in progressive-disclosure drawers so the experience is evidence-backed without being academic-heavy. In the local prototype, answers never leave the browser.

What it produces

- **Client Report:** plain-language capacity signature, top signals, a differential lens across the two pathways, small behavioral experiments, and care-conversation prompts the client can bring to a prescriber or therapist.
- **Coach Packet:** the professional-facing output — readiness, client context, first-session priorities, verification questions, contradictions to check, referral/scope notes, and claim caveats. This converts raw self-report into pre-session signal and is the core SaaS wedge.
- **Concierge Method:** a source-informed product architecture page drawn from open digital-health, survey, voice, and conversational-health patterns.

Design decisions worth stealing

- **Deterministic scoring, not AI judgment.** The spine is scored by a pure, tested scoring module. No LLM decides what a response means.
- **Safety routing outside any AI layer.** Crisis/safety items are handled deterministically and their answers are excluded from every generated summary and persisted payload.
- **Claim guardrails as code.** Copy rules programmatically block diagnostic, validation, treatment, certainty, and protected-style language; a verification gate (*npm run verify*) enforces this plus data-integrity and evidence-reference checks on every change.
- **Client/professional output split.** The client sees reflection; the professional sees structured review notes. Same data, two audiences, no leakage of clinical framing into consumer copy.
- **Privacy-first defaults.** Local-first storage, mock-patient-only persistence, redaction of private safety answers, export/delete controls even in the preview stack.

Architecture at a glance

Intentionally simple prototype: static HTML/JS single-page app with browser localStorage, a deterministic scoring spine, an evidence registry, and claim-guardrail modules — plus a thin Express/Postgres layer (Docker Compose, bound to localhost) for saving mock-patient sessions. Unit tests cover section structure, scoring, evidence mapping, safety exclusion, and claim controls. The planned build path: typed framework (Next.js/SvelteKit), auth and encrypted persistence, coach dashboard, audit logging, then a confirm-before-record voice flow (speak → transcribe → one-sentence summary → user confirms → scored value recorded; no free chat around crisis, diagnosis, medication, or hormone therapy; no raw audio stored by default).

Status and scope

Working local prototype, pre-beta. Construct-informed and experimental: it does not diagnose, validate clinical status, recommend treatment, or replace medical or mental health care. A security threat model and an EMA/digital-phenotyping platform evaluation (vendor security questionnaire, scoring rubric, open-source options review) gate any move toward real participant data.

Prepared for discussion with The Technology-Informed Therapist (thetint.co). Shared for review only — product concept, item spine, scoring model, and report architecture are proprietary to Charlie Robinson. Contact: charles.robinson789@gmail.com
